1. KANAVU STARTUP VILLAGE

1.1 COMPANY PROFILE

Kanavu Startup Village (KSV) is an entrepreneurship and innovation-focused ecosystem located at Annamalaikottai, Sivagiri, Erode, Tamil Nadu – 638109. It is part of the broader Kanavu organization, which works across entrepreneurship, technology, education, communication development and social initiatives. The organization was founded by Karthi Easwaramoorthy and Chitrabanu Duraisamy.

Kanavu Startup Village was developed with the idea of creating opportunities for entrepreneurs and technology professionals outside major metropolitan cities. Its focus is particularly important for rural and semi-urban communities where talented students, engineers and aspiring entrepreneurs may have fewer opportunities to access startup networks, mentors and professional infrastructure.

The organization follows the concept of “Dream. Start. Grow.” and aims to provide an environment where an idea can be converted into a practical business. KSV provides an ecosystem involving workspace, mentorship, networking, training, workshops and startup-oriented support.

Location:

Kanavu Startup Village,
Annamalaikottai, Sivagiri – 638109,
Erode District, Tamil Nadu.

Major Areas of Work

- Entrepreneurship and startup development
- Technology and digital solutions
- Skill development
- English communication
- Co-working and professional workspace
- Social welfare activities
- Community development
- Fitness and social awareness activities

1.2 MISSION

The main mission of Kanavu is to create opportunities for people by combining technology, entrepreneurship, education and social development.

One of the important objectives of Kanavu Startup Village is to reduce the technology and opportunity gap between rural and urban areas.

Rural students and entrepreneurs often have innovative ideas but may not have easy access to startup communities, industry experts and professional networks.

1. Rural Entrepreneurship

KSV encourages people from rural and semi-urban areas to explore entrepreneurship and develop their own business ideas.

2. Technology Access

Technology is used as an important tool for developing businesses, improving productivity and solving real-world problems.

3. Skill Development

Students and graduates are encouraged to develop practical technical and professional skills that can improve their career opportunities.

4. Community Development

Kanavu also works on social initiatives that support education, healthcare, welfare and community participation.

5. Innovation

The organization encourages individuals to think differently, identify problems and develop practical solutions.

1.3 VISION

The vision of Kanavu Startup Village is to create an environment where innovation and entrepreneurship are not restricted to large cities.

KSV aims to demonstrate that rural talent can participate in the wider startup ecosystem without necessarily moving to a major metropolitan city.

The vision includes:

- Creating opportunities for rural entrepreneurs
- Supporting innovative business ideas
- Developing future-ready professionals
- Improving access to technology
- Encouraging startup culture
- Connecting people with mentors and professional networks
- Supporting inclusive economic development

1.4 LEADERSHIP & EXPERIENCE

Kanavu was founded by Karthi Easwaramoorthy and Chitrabanu Duraisamy.

Karthi Easwaramoorthy – Founder & CEO

Karthi Easwaramoorthy is associated with entrepreneurship and technology initiatives through Kanavu. Before Kanavu, he was involved with TicketGoose.com, giving him experience in building and operating a technology-driven business.

His entrepreneurial experience provides an important foundation for Kanavu Startup Village. Rather than concentrating only on theoretical entrepreneurship, the organization emphasizes practical startup development, business thinking, technology and market-oriented approaches.

Karthi's experience is reflected in the startup ecosystem developed at Kanavu, where entrepreneurs can obtain guidance and opportunities to interact with other professionals.

Chitrabanu Duraisamy – Co-Founder & COO

Chitrabanu Duraisamy is the co-founder and COO of Kanavu.

Importance of Leadership

Strong leadership is essential for a startup ecosystem because entrepreneurs require more than just physical infrastructure. They need:

- Guidance
- Business knowledge
- Industry experience
- Networking opportunities
- Technical support

- Motivation

Kanavu's leadership approach combines entrepreneurial experience with education and social development.

1.5 CORE EXPERTISE

Kanavu's activities cover several interconnected areas. These areas help create a complete ecosystem for students, entrepreneurs and professionals.

1.6 ENTREPRENEURSHIP & STARTUP DEVELOPMENT

Entrepreneurship is one of the central areas of Kanavu Startup Village.

KSV provides an environment where entrepreneurs can discuss ideas, develop products and understand the different stages of building a business.

According to Kanavu's technology platform, the ecosystem includes support such as mentorship, workshops, networking and dedicated areas related to Product, Design and Go-to-Market strategy.

A startup generally passes through several stages:

Idea → Research → Prototype → Product → Market → Growth

KSV aims to support entrepreneurs across these stages.

Benefits for Entrepreneurs

- Opportunity to interact with experienced professionals
- Startup-oriented workspace
- Mentoring
- Networking
- Product development support

- Business discussions
- Workshops and seminars

1.7 TECHNOLOGY & DIGITAL SOLUTIONS

Technology plays an important role in modern businesses. Kanavu Technologies focuses on entrepreneurship and innovation and supports the development of technology-oriented solutions.

Digital technology can help businesses:

- Reach customers online
- Improve communication
- Automate business activities
- Manage information
- Develop digital products
- Improve marketing
- Analyze business performance

For students, exposure to such an environment can help connect classroom knowledge with real-world applications.

1.8 KANAVU STARTUP VILLAGE

Kanavu Startup Village is the main entrepreneurship ecosystem.

It is designed to support startups, entrepreneurs and technology professionals, especially from rural and underrepresented areas.

2. INTRODUCTION TO INFO POWER

2.1 Introduction

Info Power is one of the incubated ventures associated with the Technology Business Incubator at Kongu Engineering College (TBI@KEC). According to the TBI@KEC graduated incubatee listing, Info Power is classified under the Public Transport sector and its website is listed as infopowerindia.com.

Public transportation is an important part of modern society because it provides affordable and accessible mobility for students, employees, senior citizens and the general public. With the growth of cities and increasing traffic congestion, technology has become an important tool for improving the efficiency, safety and reliability of public transport systems.

Info Power can be studied in this context as a technology-oriented venture associated with public transportation.

2.2 Info Power and TBI@KEC

TBI@KEC was established with support from the Department of Science and Technology (DST), Government of India, with the objective of nurturing technology-based entrepreneurship.

The TBI incubatee list specifically records:

Incubatee: Info Power
Domain / Sector: Public Transport
Website: infopowerindia.com

2.3 Technology Business Incubator @ Kongu Engineering College

Technology Business Incubation is a process that helps new entrepreneurs and startup ventures develop their ideas into commercially useful products and services. TBI@KEC is a joint venture of Kongu Engineering College and the Department of Science and Technology, Government of India.

2.4 Support Provided by TBI

TBI@KEC provides several types of support to entrepreneurs. These include:

1. **Infrastructure Support**
   Incubatees can utilize suitable infrastructure and laboratory facilities for product development.
2. **Technical Mentoring**
   Technical experts and mentors can guide entrepreneurs in developing and improving their products.
3. **Business Development Support**
   Entrepreneurs can receive guidance related to business development and commercialization.
4. **Funding Assistance**
   TBI supports eligible innovators through various funding schemes and programs.
5. **Networking**
   Startups can connect with investors, industries, mentors and ecosystem partners.

6. **Prototype Development**

   Ideas can be transformed into working prototypes before entering the market.

7. **Market Validation**

   TBI helps entrepreneurs understand problem-solution fit and product-market fit.

2.5 Importance to Info Power

For a public transport technology venture such as Info Power, an incubation environment can be valuable because transportation solutions may require a combination of electronics, software, communication and information-management technologies.

2.6 Introduction to Public Transport

Public transport includes services such as buses, trains, metro systems and other shared transportation systems.

It provides mobility to a large number of people and helps reduce dependence on individual vehicles.

2.7 Intelligent Transportation Systems

An **Intelligent Transportation System (ITS)** combines transportation infrastructure with information and communication technologies.

A typical intelligent public transport system can include:

- GPS-based vehicle tracking
- Passenger information systems
- Electronic ticketing
- Centralized monitoring

- Route management
- Vehicle communication

2.8 Need for Technology in Public Transport

Technology can address several common public transport challenges:

- Uncertainty about bus arrival times
- Difficulty in monitoring vehicles
- Traffic-related delays
- Manual data collection
- Inefficient route management
- Passenger communication problems
- Difficulty in analysing transport operations

2.9 Public Transport as a Technology Domain

The classification of Info Power under **Public Transport** in the TBI@KEC incubatee records establishes its connection with the transportation technology sector.

A simplified transportation technology architecture can be represented as:

Vehicle → GPS/Sensors → Communication Network → Central Server → Transport Management → Passenger Information

2.10 Vehicle Monitoring

Vehicle monitoring is one important application of technology in public transport.

A monitoring system can help transport operators determine:

- Current vehicle location
- Route followed by the vehicle
- Vehicle movement
- Arrival information
- Operational status
- Route performance

GPS-based tracking systems are already used in public transportation to provide vehicle-location information and passenger information.

2.11 Passenger Information

Passengers need accurate information to plan their journeys.

Digital passenger information systems can provide information about routes, stops and expected arrival times.

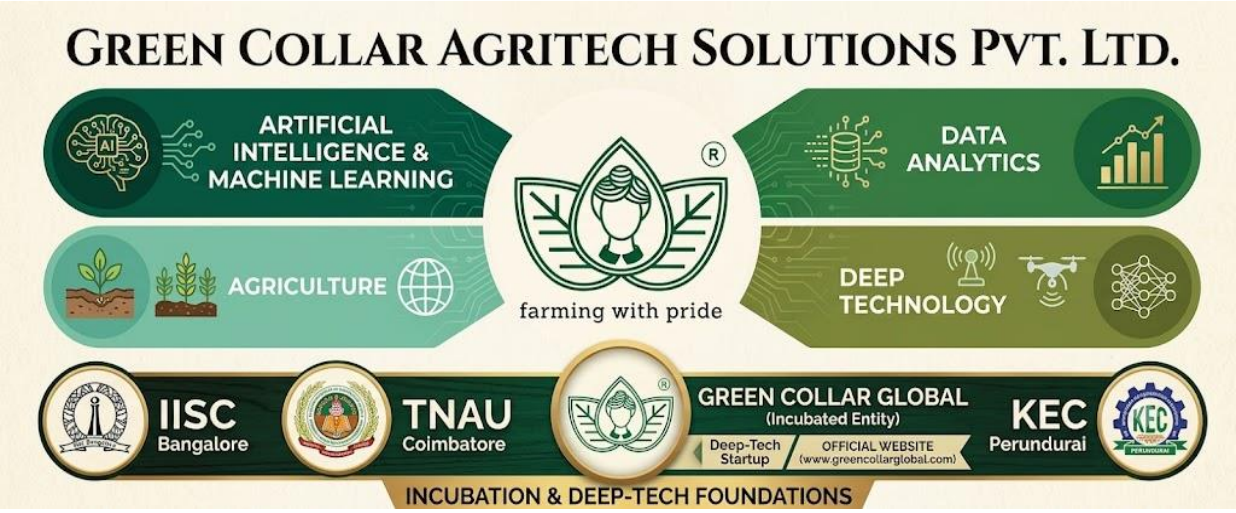

2.12 Electronic Ticketing

Electronic ticketing can reduce dependence on paper tickets and manual processes.

India is increasingly integrating public transport ticketing with digital networks.

ONDC's public-transport initiative, for example, supports bus and metro ticketing across multiple consumer applications.

3. COMPANY INTRODUCTION

3.1 Introduction

Green Collar Agritech Solutions Pvt. Ltd. is an agriculture-focused technology company working at the intersection of **agriculture, artificial intelligence, machine learning, deep technology and data analytics**.

According to the company's official website, Green Collar Global is a deep-tech startup incubated at **IISc Bangalore, TNAU Coimbatore and KEC Perundurai**.

3.2 Company Profile

Particular	**Details**
Company	Green Collar Agritech Solutions Pvt. Ltd.
Sector	Agriculture / Agritech
Technology	AI, ML, Data Science and Deep Tech
Major Focus	Agri-commodity quality and safety

Major Product	TARAM
Incubation Ecosystem	IISc Bangalore, TNAU Coimbatore, KEC Perundurai
Website	greencollaragri.com

3.3 Agriculture as a Technology Opportunity

- Artificial Intelligence
- Machine Learning
- Computer-based analytics
- Sensors
- Digital platforms
- Data science

3.4 Company's Agriculture Focus

Green Collar's official website states that its solutions cover the crop cycle from plant growth to harvested produce.

The company focuses on:

1. Real-time quality assessment
2. Quality prediction during crop growth
3. Food safety
4. Commodity trading
5. Export quality
6. Farmer and FPO support

3.5 Mission

The company's stated mission is based on **quality, safety and sustainability** within the agricultural value chain.

Quality is important because agricultural products must meet suitable standards before reaching markets and consumers.

3.6 Vision

Green Collar's overall approach is to reshape the future of agriculture by combining advanced technology with agricultural domain knowledge.

The company aims to make agricultural quality information more accessible, rapid and useful for stakeholders across the value chain.

3.7 Objectives

1. Develop technology-based agricultural solutions.
2. Improve agricultural commodity quality assessment.
3. Provide faster on-site analysis.
4. Support quality prediction during crop growth.
5. Improve food safety.
6. Help farmers and FPOs improve market access.
7. Support commodity trading.

3.8 Importance of the Objectives

These objectives connect technology with practical agricultural problems.

For example, if a farmer or buyer can obtain quality information quickly, decisions about buying, selling, processing or exporting can be made more effectively.

3.9 Artificial Intelligence

Artificial Intelligence enables computer systems to perform tasks that normally require human intelligence.

In agriculture, AI can be used to analyze large amounts of information and identify patterns related to crop and commodity quality.

3.10 Machine Learning

Machine Learning allows systems to learn patterns from data.

For agricultural applications, historical datasets can be used to develop models that identify relationships between agricultural characteristics and quality outcomes.

3.11 Data Analytics

Data analytics helps convert raw agricultural information into useful insights.

Descriptive Analytics

Descriptive analytics helps understand what is happening or what has already happened.

Predictive Analytics

Predictive analytics attempts to determine what may happen in the future using available data.

Prescriptive Analytics

Prescriptive analytics can help identify possible actions based on available information.

3.12 Deep Technology

Deep technology refers to solutions based on significant scientific or engineering development.

Green Collar describes itself as a deep-tech startup and combines hardware, software and analytics in its approach.

3.13 Introduction to TARAM

One of Green Collar's major product lines is TARAM.

The Foundation for Science Innovation and Development at IISc describes TARAM as an instant and portable agricultural commodity quality assessment solution.

3.14 Need for Quality Assessment

Agricultural commodities may have different quality levels based on:

- Moisture
- Maturity
- Processing
- Storage conditions
- Crop characteristics

3.15 Portable Assessment

A portable assessment solution can provide an important advantage because quality-related information can potentially be obtained closer to where agricultural commodities are being handled.

3.16 Real-Time Assessment

One of Green Collar's solution areas is **real-time quality assessment**.

Traditional quality assessment may require sample collection and laboratory procedures.

3.17 Working Concept

A simplified working process can be represented as:

Agricultural Commodity

↓

Sample / Product Analysis

↓

Hardware / Data Collection

↓

AI & Analytics

↓

Quality Parameters

↓

Decision Making

3.18 Predictive Agriculture

Agriculture is affected by several variables, including weather, cultivation practices, soil conditions and crop development.

Predictive analytics can help farmers and agricultural stakeholders anticipate potential quality-related issues.

3.19 Predictive Process

A simplified process can be:

Data Collection

↓

Data Processing

↓

Machine Learning Model

↓

Prediction

↓

Risk Identification

↓

Recommended Action

3.20 Importance

Early identification of potential quality problems can help farmers and producers take corrective action before harvesting.

This approach moves agriculture from only reacting to problems after harvest toward more proactive quality management.

3.21 Importance of Food Safety

Food safety is an important part of the agricultural value chain.

Agricultural commodities eventually enter food and processing systems.

Therefore, quality assessment should also consider safety requirements.

3.22 Food Safety and Technology

Technology can support food safety through:

- Quality measurement
- Data collection
- Testing
- Monitoring
- Analytics
- Traceability
- Decision support

3.23 Role in the Agricultural Value Chain

Food safety connects several stakeholders:

Farmer → Aggregator → Processor → Trader → Exporter → Consumer

Quality and safety information can become increasingly important as agricultural products move through these stages.

3.24 Complete Agricultural Value Chain

Green Collar's website indicates that its solutions address quality and safety concerns across the agricultural trade value chain.

Farmer

↓

FPO / Aggregator

↓

Procurement

↓

Commodity Trading

↓

Processing

↓

Export

↓

Consumer

3.25 Farmers

Farmers can use quality-related information to improve the marketability of their produce.

The company's website lists several commodities within its solution focus, including:

- Corn
- Cumin

4. SUGGESTED NEW STARTUP

4.0 CodeSphere Software Solutions

Type: Computer Software / IT Startup

Industry: Software Development & Digital Solutions

Startup Model: Low-cost software products and customized solutions for small businesses, colleges and individuals.

4.1 BASIC CONCEPT

CodeSphere Software Solutions is a proposed computer software startup designed to provide affordable and easy-to-use digital solutions for small businesses, educational institutions and individual users.

The main idea is to develop software applications that help users manage their daily activities, records, communication and business operations through a centralized digital platform.

Many small organizations still depend on notebooks, spreadsheets, messaging applications and separate software tools to manage their activities.

Basic concept:

Customer → Select Software → Register/Login → Enter Data → Manage Operations → Generate Reports

Main focus areas:

- Business management software
- Student and institution software
- Customer record management
- Inventory management
- Billing and invoice management
- Report generation

4.2 PROBLEM IDENTIFICATION

Small businesses and organizations often face difficulties in managing their information efficiently.

Customer details, product records, invoices, employee information and other important data may be maintained using notebooks, spreadsheets or multiple applications.

When information is stored in different places, users may spend more time searching for required records.

Manual data entry can also result in mistakes, duplicate information and difficulty in preparing reports.

Problems identified:

- Business information is stored in different places.

- Manual record maintenance requires more time.
- Small businesses may not have affordable software.
- Preparing reports manually can be difficult.

4.3 PROPOSED SOLUTION

CodeSphere proposes a centralized software platform that allows users to manage their important activities digitally.

The system can provide separate modules for customers, products, employees, billing and reports.

For example:

Login → Dashboard → Customer Management → Product Management → Billing → Reports

Users can add, edit, search and manage their information from a single system.

The startup can initially develop a basic web application and later introduce mobile applications, cloud services and advanced automation features based on customer requirements.

Proposed solution includes:

- Centralized software platform
- User login and authentication
- Customer management
- Product management

4.4 OBJECTIVES OF CODESPHERE

The primary objective of CodeSphere Software Solutions is to develop affordable, reliable and user-friendly computer software solutions for small businesses, educational institutions and individual users.

Major Objectives

1. To develop simple and user-friendly software that can be easily operated by users with basic computer knowledge.
2. To reduce manual work by converting paper-based and repetitive activities into efficient digital processes.
3. To improve data organization by providing centralized databases for storing and managing customer, product, employee and transaction information.
4. To provide affordable software solutions for small businesses, startups, educational institutions and individual entrepreneurs.
5. To develop customized software according to the specific requirements of different customers and organizations.

4.5 TARGET USERS

The primary target market for CodeSphere consists of users who require affordable, reliable and easy-to-use digital solutions.

Starting with a limited target market can help the startup understand customer requirements, collect feedback and improve its products before expanding to larger markets.

Target users include:

- Small business owners
- Retail shops

- Startup companies
- Educational institutions
- Colleges and departments
- Service providers
- Freelancers
- Small offices

4.6 TECHNOLOGY AND DEVELOPMENT

CodeSphere would be primarily a software-based startup.

Therefore, the company does not require manufacturing machinery or large physical infrastructure during the initial stage.

Possible technologies

Frontend:

- HTML
- CSS
- JavaScript
- React.js or Angular

Backend:

- Python
- Flask
- Django
- Node.js

Database:

- MySQL
- PostgreSQL or similar database systems

Additional technologies:

- REST API
- Cloud hosting
- Cloud storage
- Git and GitHub

Software Development Process

The company can follow a systematic software development process.

Requirement Analysis → System Design → Development → Testing → Deployment → Maintenance

1. Requirement Analysis

The development team first communicates with the customer to understand the problem and required features.

2. System Design

After collecting requirements, the team prepares the database structure, user interface and system architecture.

3. Development

Developers create the frontend, backend and database components of the application.

4. Testing

The software is tested to identify programming errors, security problems, usability issues and performance problems.

5. Deployment

After successful testing, the application can be deployed on a suitable server or cloud platform.

4.7 APPROXIMATE INITIAL COST

The initial investment of CodeSphere should include both development-related expenses and basic business establishment costs.

Domain registration	₹800
Basic hosting	₹1,500
Database and storage	₹1,000
Logo and branding	₹500
Promotional materials	₹1,000
Office furniture/setup	₹5,000
Office/room advance	₹10,000
Computers and accessories	₹40,000
Software/testing expenses	₹2,000
Internet installation	₹1,000
Legal/registration miscellaneous	₹3,000
Emergency/contingency	₹5,000
Approximate Initial Setup Cost	**₹70,800**

Monthly Operating Expenses

Monthly Requirement	Approximate Cost
Office/room rent	₹8,000
Software Developer salary	₹20,000
Web/UI Developer salary	₹15,000
Marketing & Support salary	₹12,000
Internet and electricity	₹3,000
Hosting and cloud services	₹2,000
Travel and communication	₹2,000
Miscellaneous expenses	₹2,000
Estimated Monthly Expense	**₹64,000**

Initial Employees

1. Software Developer – ₹20,000/month

The software developer is responsible for frontend/backend development, database integration, debugging, testing and software maintenance.

2. Web/UI Developer – ₹15,000/month

The web/UI developer designs responsive interfaces and ensures that websites and applications are easy to use on different devices.

3. Marketing and Support Staff – ₹12,000/month

The marketing and support employee communicates with customers, promotes the company's services, organizes demonstrations and provides basic customer assistance

5. CONCLUSION

The study of Kanavu Startup Village, Info Power, Green Collar Agritech Solutions Pvt. Ltd., and the proposed CodeSphere Software Solutions provides a clear understanding of how entrepreneurship, technology and innovation can be used to solve real-world problems. Kanavu Startup Village demonstrates the importance of creating a supportive startup ecosystem, particularly for students, entrepreneurs and professionals from rural and semi-urban areas. Through workspace, mentorship, networking, skill development, training and community-oriented activities, Kanavu encourages individuals to transform their ideas into practical opportunities.

Public transport involves challenges such as vehicle monitoring, passenger information, route management and efficient communication. Technologies such as GPS, communication networks, databases and digital applications can help improve transportation services. The incubation support provided through TBI@KEC also shows how technical mentoring, infrastructure, networking, prototype development and business support can help technology-based ventures develop their ideas.

The study of Green Collar Agritech Solutions Pvt. Ltd. demonstrates the application of advanced technology in agriculture. Its focus on real-time quality assessment, predictive agriculture, commodity trading, food safety and agricultural processing shows how technology can support different stages of the agricultural value chain. The TARAM product concept further demonstrates the importance of portable and faster agricultural commodity quality assessment.

CodeSphere can begin with a small team consisting of a software developer, web/UI developer and marketing and support staff. A small rented office or workspace can be used to control the initial investment. The proposed initial setup cost is approximately ₹70,800, while the estimated monthly operating expense is approximately ₹64,000, including room rent, employee salaries, internet, electricity, hosting, travel and miscellaneous expenses. These figures provide a basic low-budget planning model and can be modified according to the actual requirements of the startup.
